

Dental Implants

Are you embarrassed by loose dentures or a missing tooth?

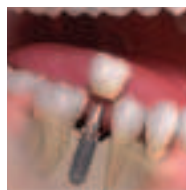

Do you struggle to eat some things that you used to really enjoy?

We would be delighted to offer you a complimentary, no obligation chat with one of our implant dentists.

At The Sandstone Dental Practice we can offer patients dental implant surgery for replacing a single tooth, multiple teeth or a full mouth.

Single tooth replacement

Replacing a single tooth with a dental implant is a straightforward procedure that usually involves minimal invasion or discomfort. Your dental implant will support a bespoke prosthetic tooth that will be created in a dental lab according to your exact specifications, and will look, feel and function just like a natural tooth.

Replacement of a few teeth

If you have two or more adjacent missing teeth, dental implants can be used to secure a dental bridge permanently in place. Unlike traditional dental bridges, which require adjacent teeth to carry extra load, implant-retained bridges are fully self-supporting and don't impact on your surrounding healthy teeth.

Replacement of all teeth

If you currently wear dentures or are facing the prospect of multiple extractions, full arch implants can offer the perfect solution. You won't need to replace every tooth with a dental implant; instead, as few as two or four dental implants can be placed to support a series of fixed bridges or a full arch.

We appreciate that dental implant treatment can seem a bit overwhelming, so we've put together a list of our patient's most frequently asked questions for your convenience on our website – www.sandstonedental.co.uk
